
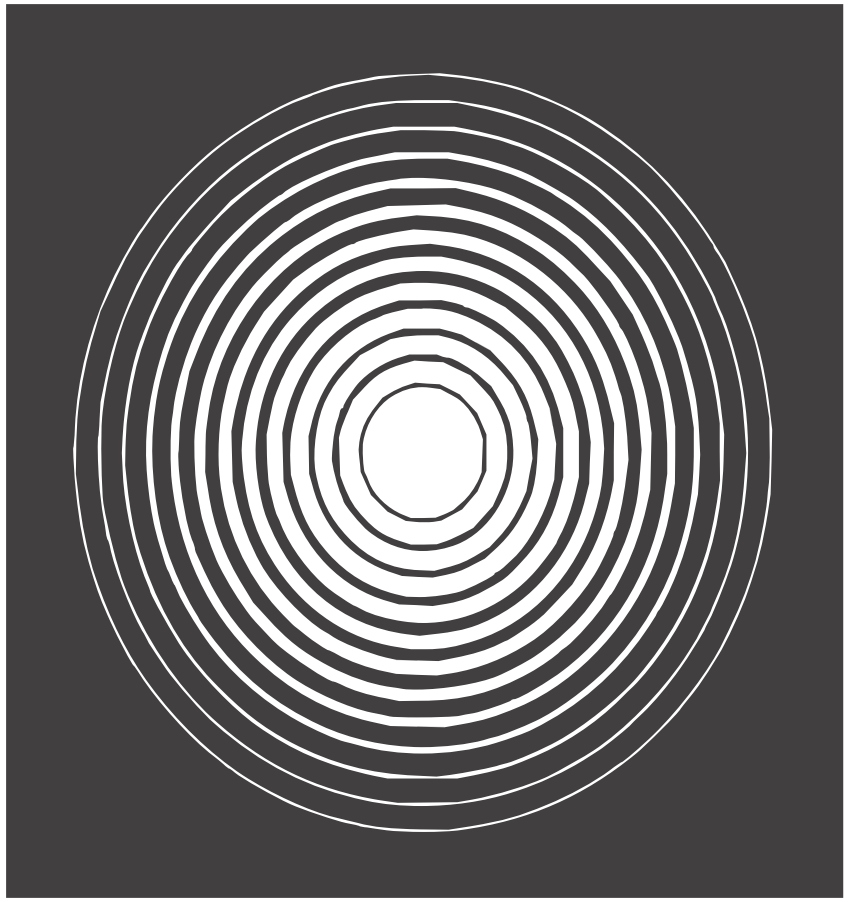
WATER AND WAVES

A COLORING BOOK BY LARK EAGLIN

A vibration is when something moves back and forth, like a guitar string or a buzzing phone.



We can't always see vibrations, but we can see the shapes they make.

Water is made of tiny building blocks called molecules.

Each water molecule has one oxygen and two hydrogens.

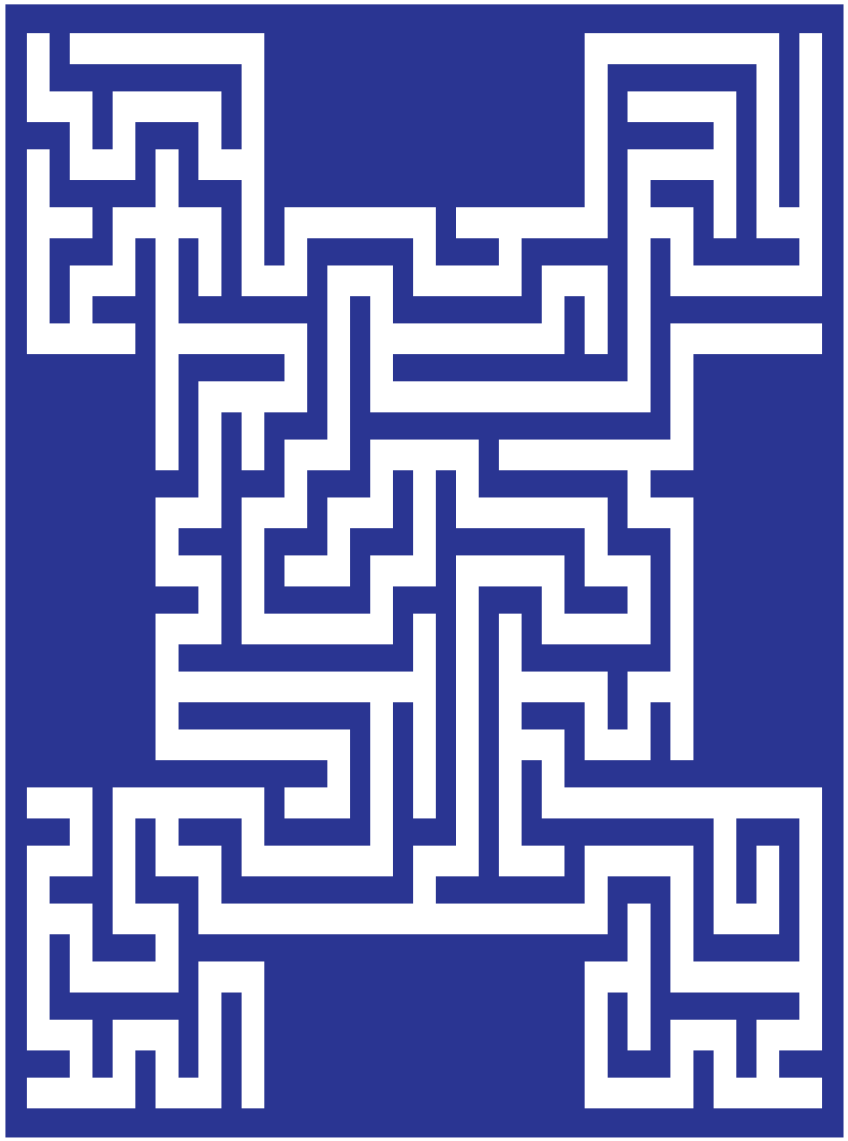
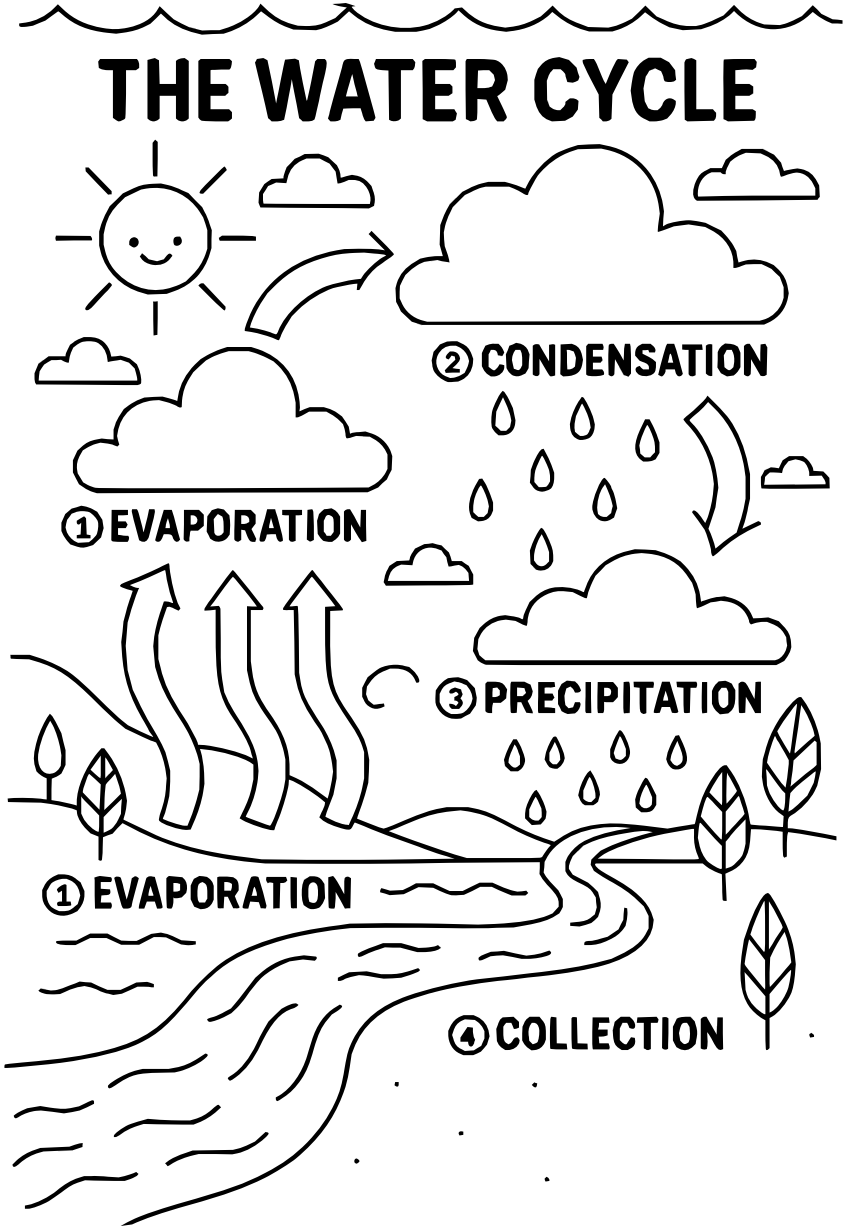
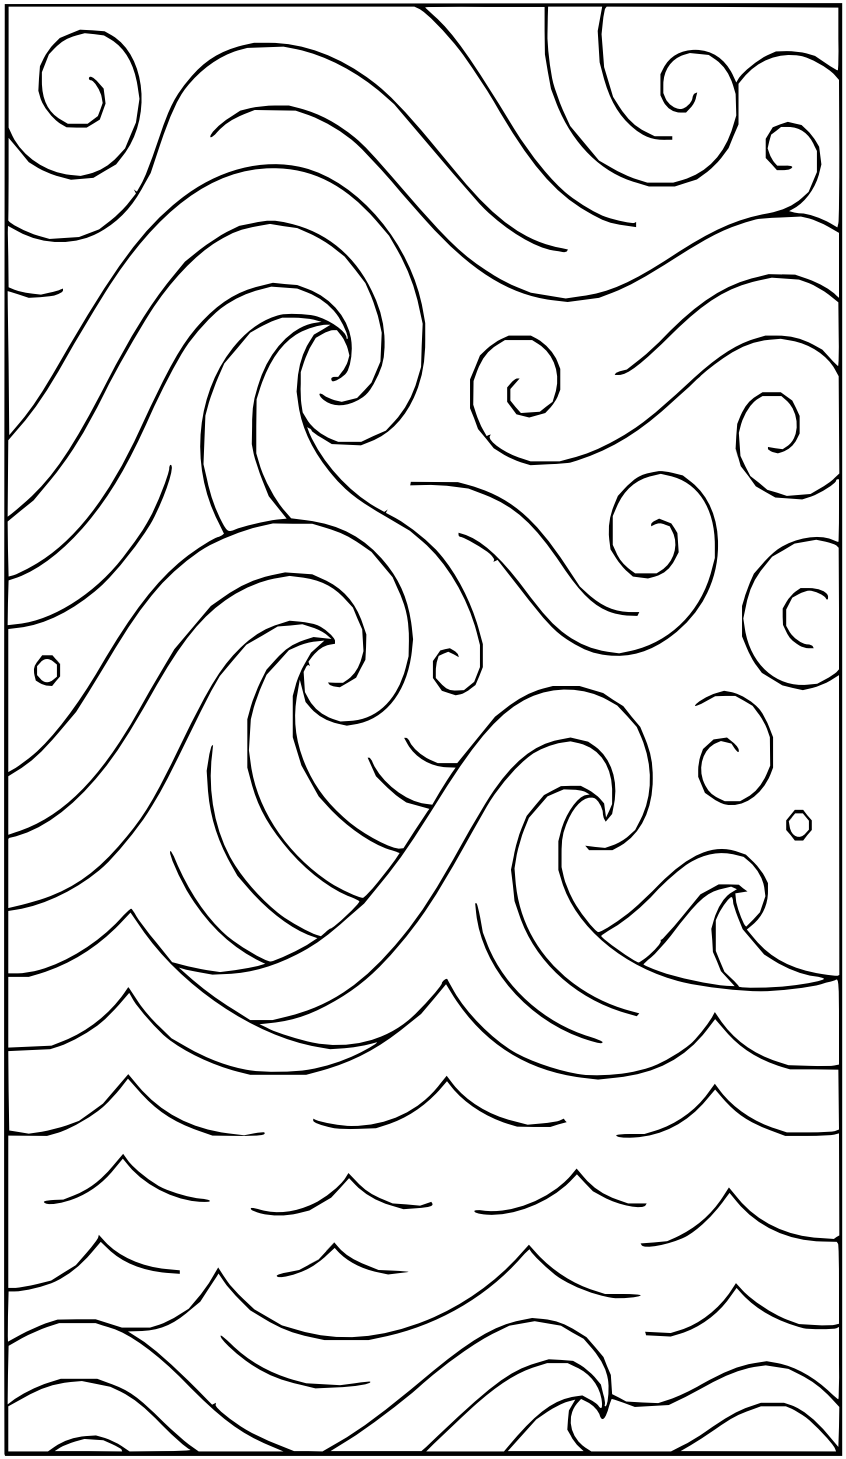
Maze 01



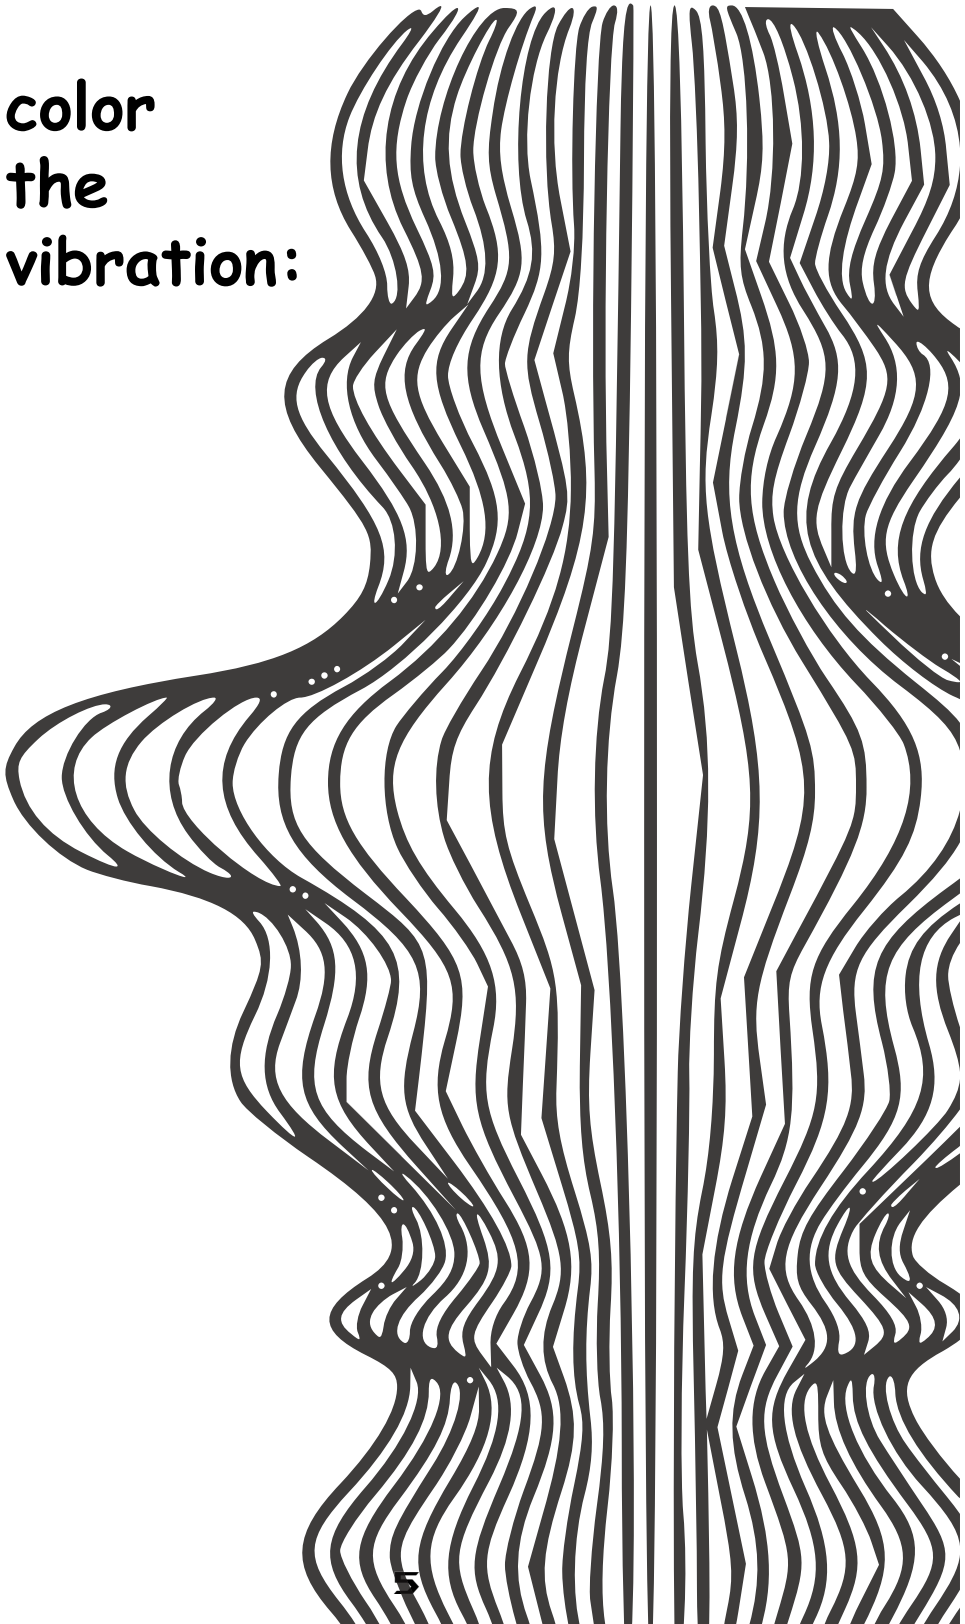
Vibrations move energy, and mazes show the paths that energy can take.



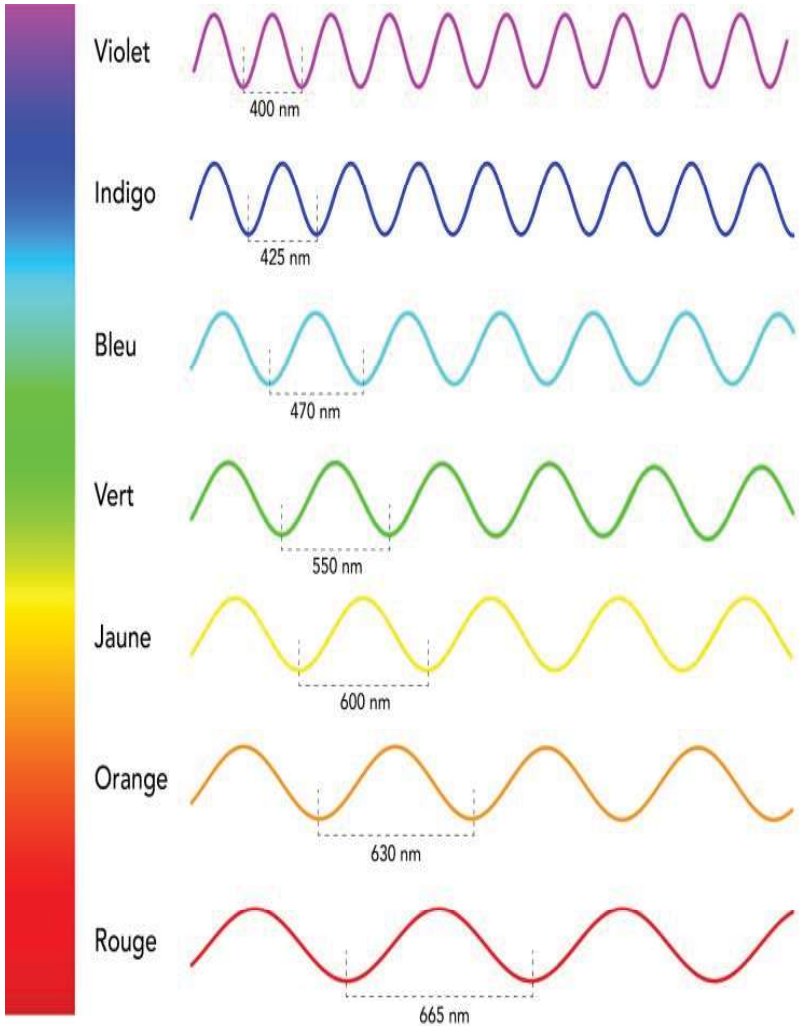
Even in the water cycle you can see how water flows in a loop like a toroid.



color the vibration:

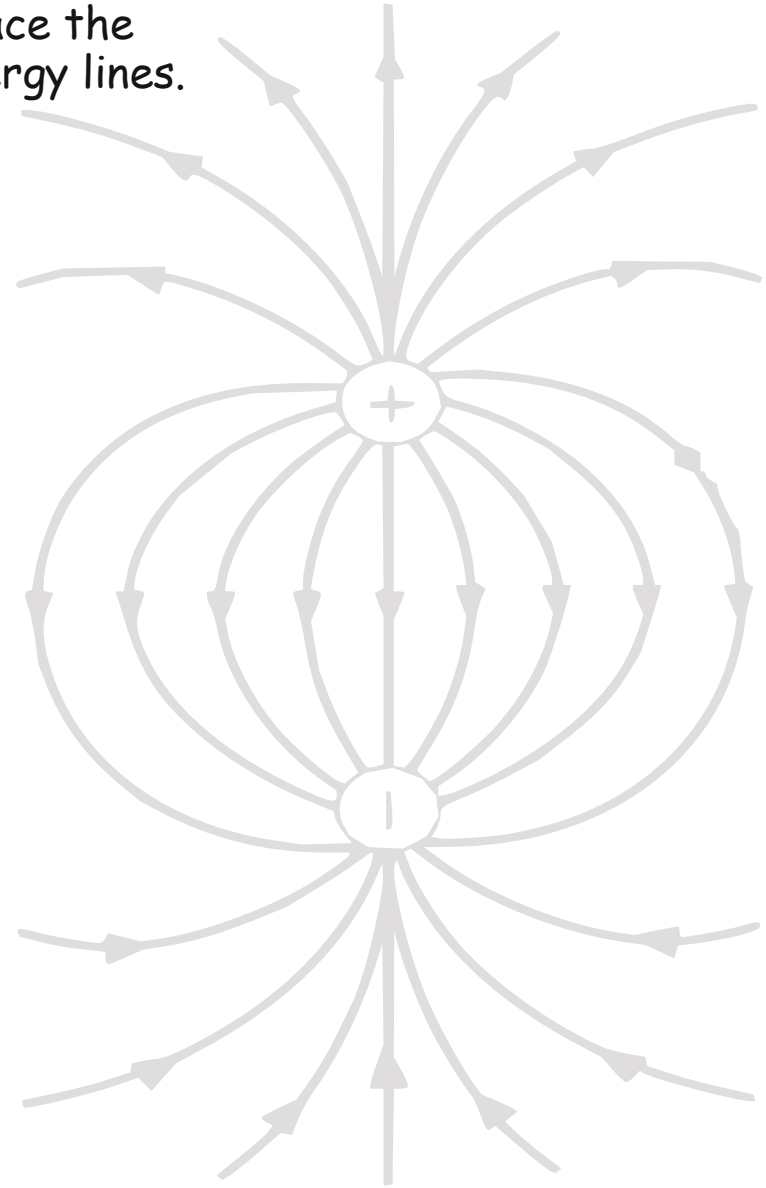


Frequency is how fast a vibration repeats.



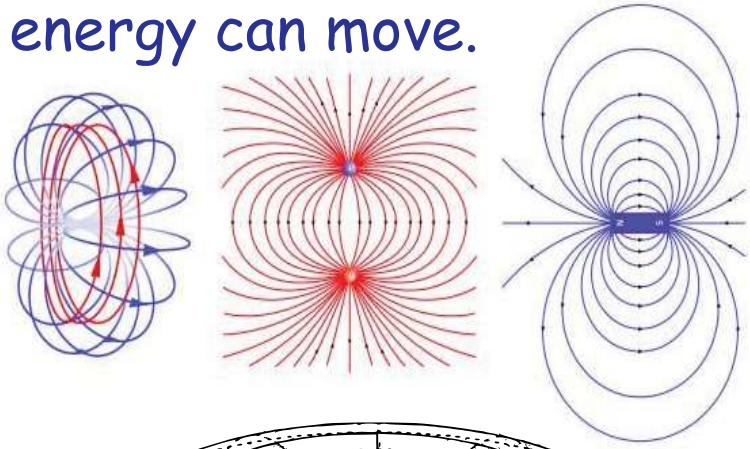
It tells us how close together the waves are.

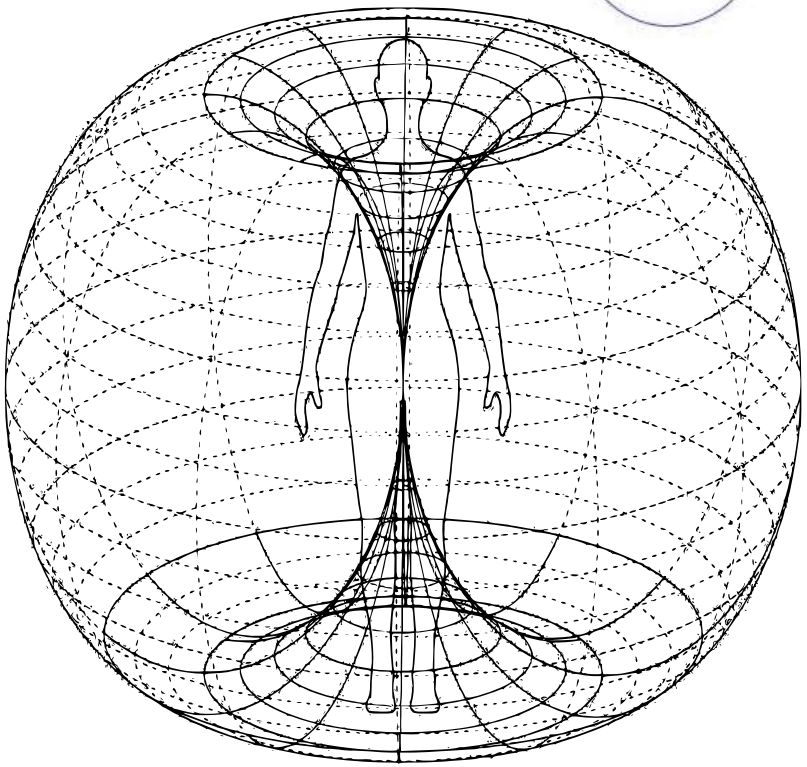
Trace the energy lines.

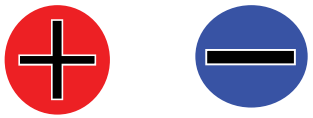


Positive (+) and negative (-) are two kinds of electric charge.

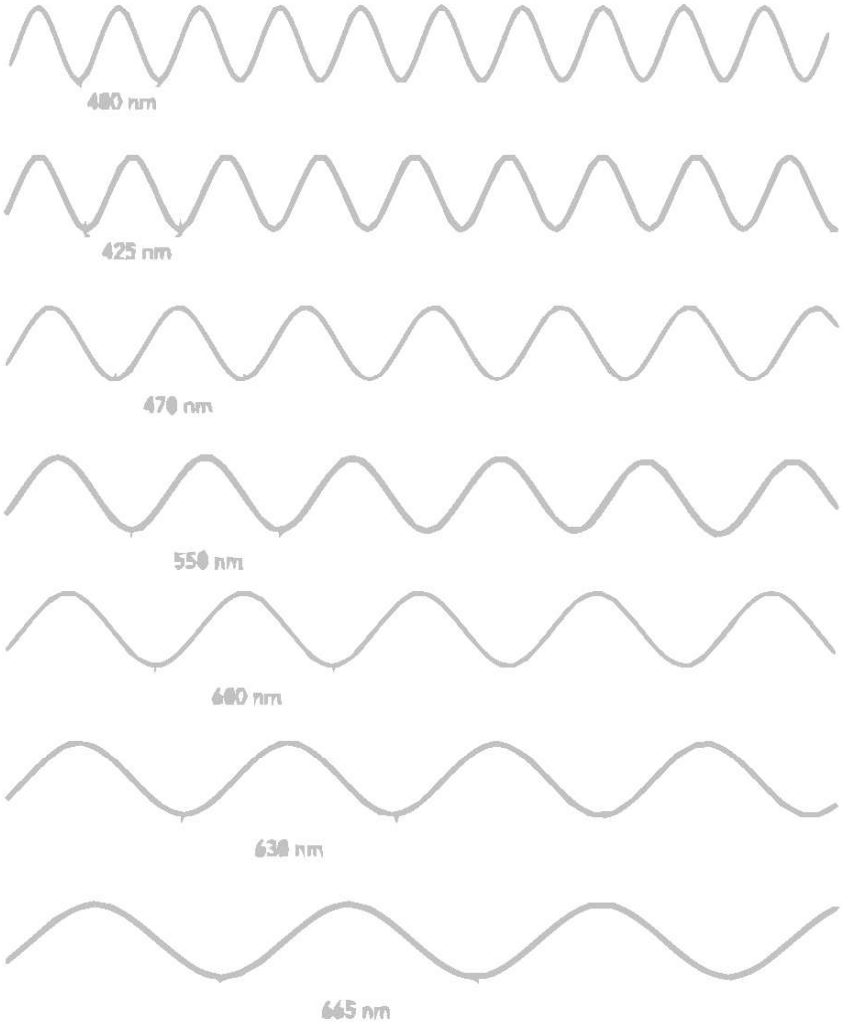
Electricity is another way energy can move.



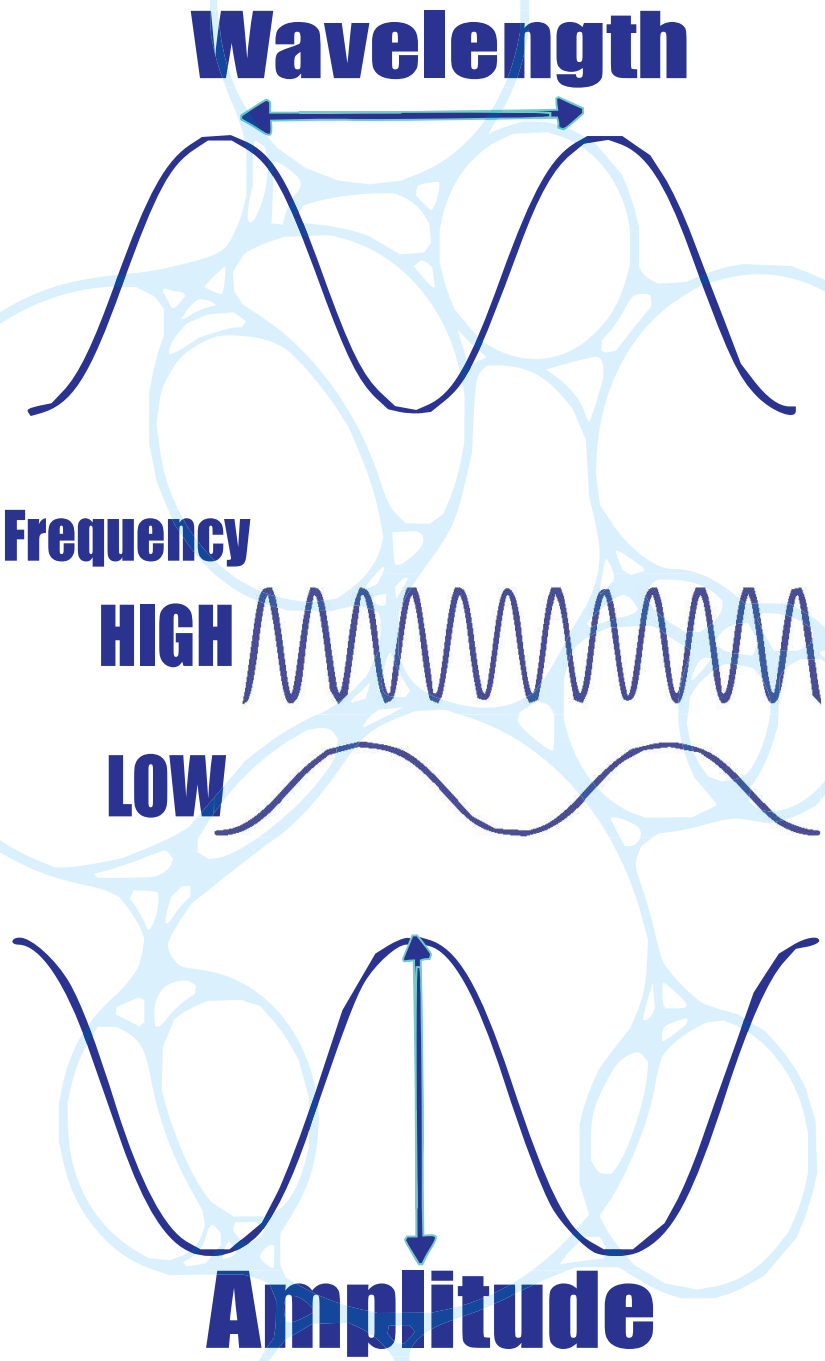


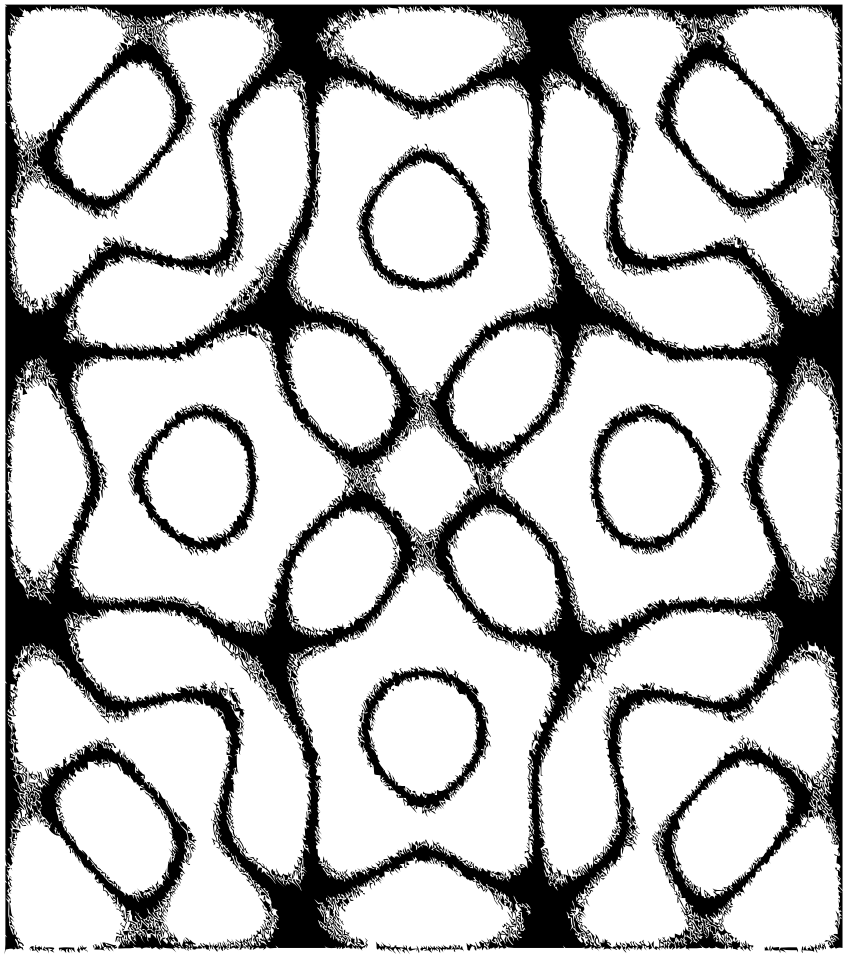


Trace the waves below. Use the color that matches the wave.



Slow waves are spread out. Fast waves are close together.

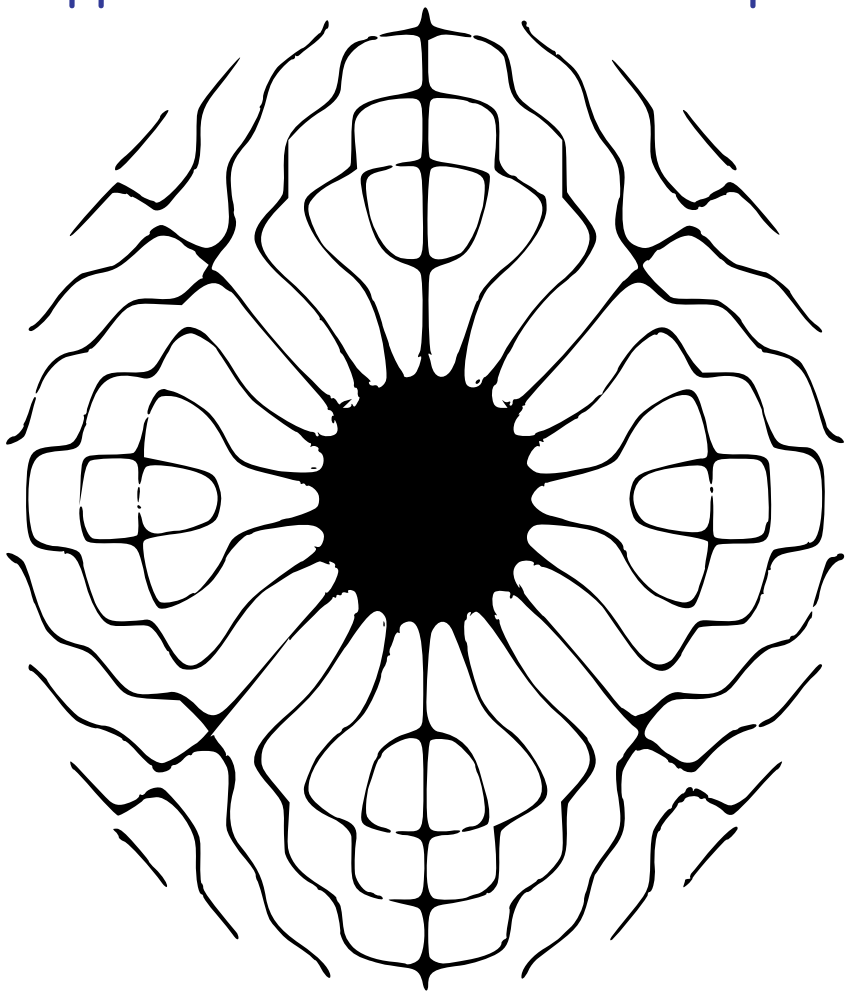




When sound moves through water, it makes patterns we can see. Different sounds make different shapes!

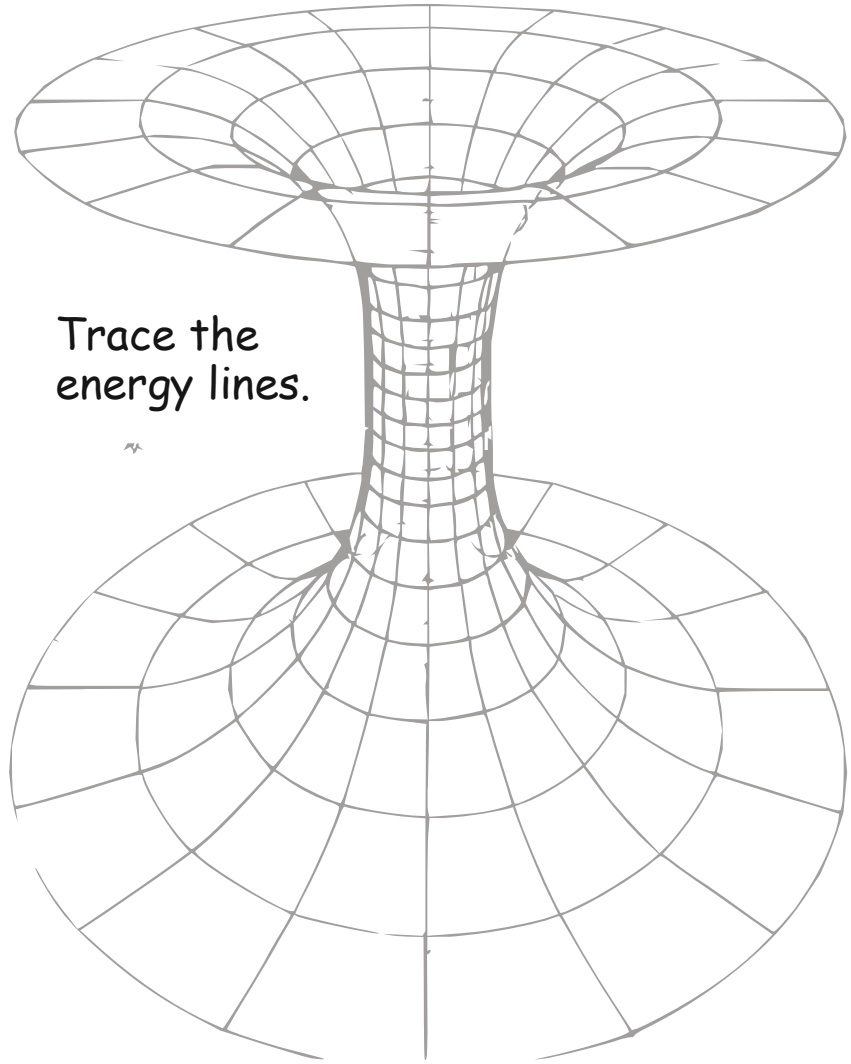
Cymatics

(say it like "si-MA-tic!") is what happens when sound makes shapes.



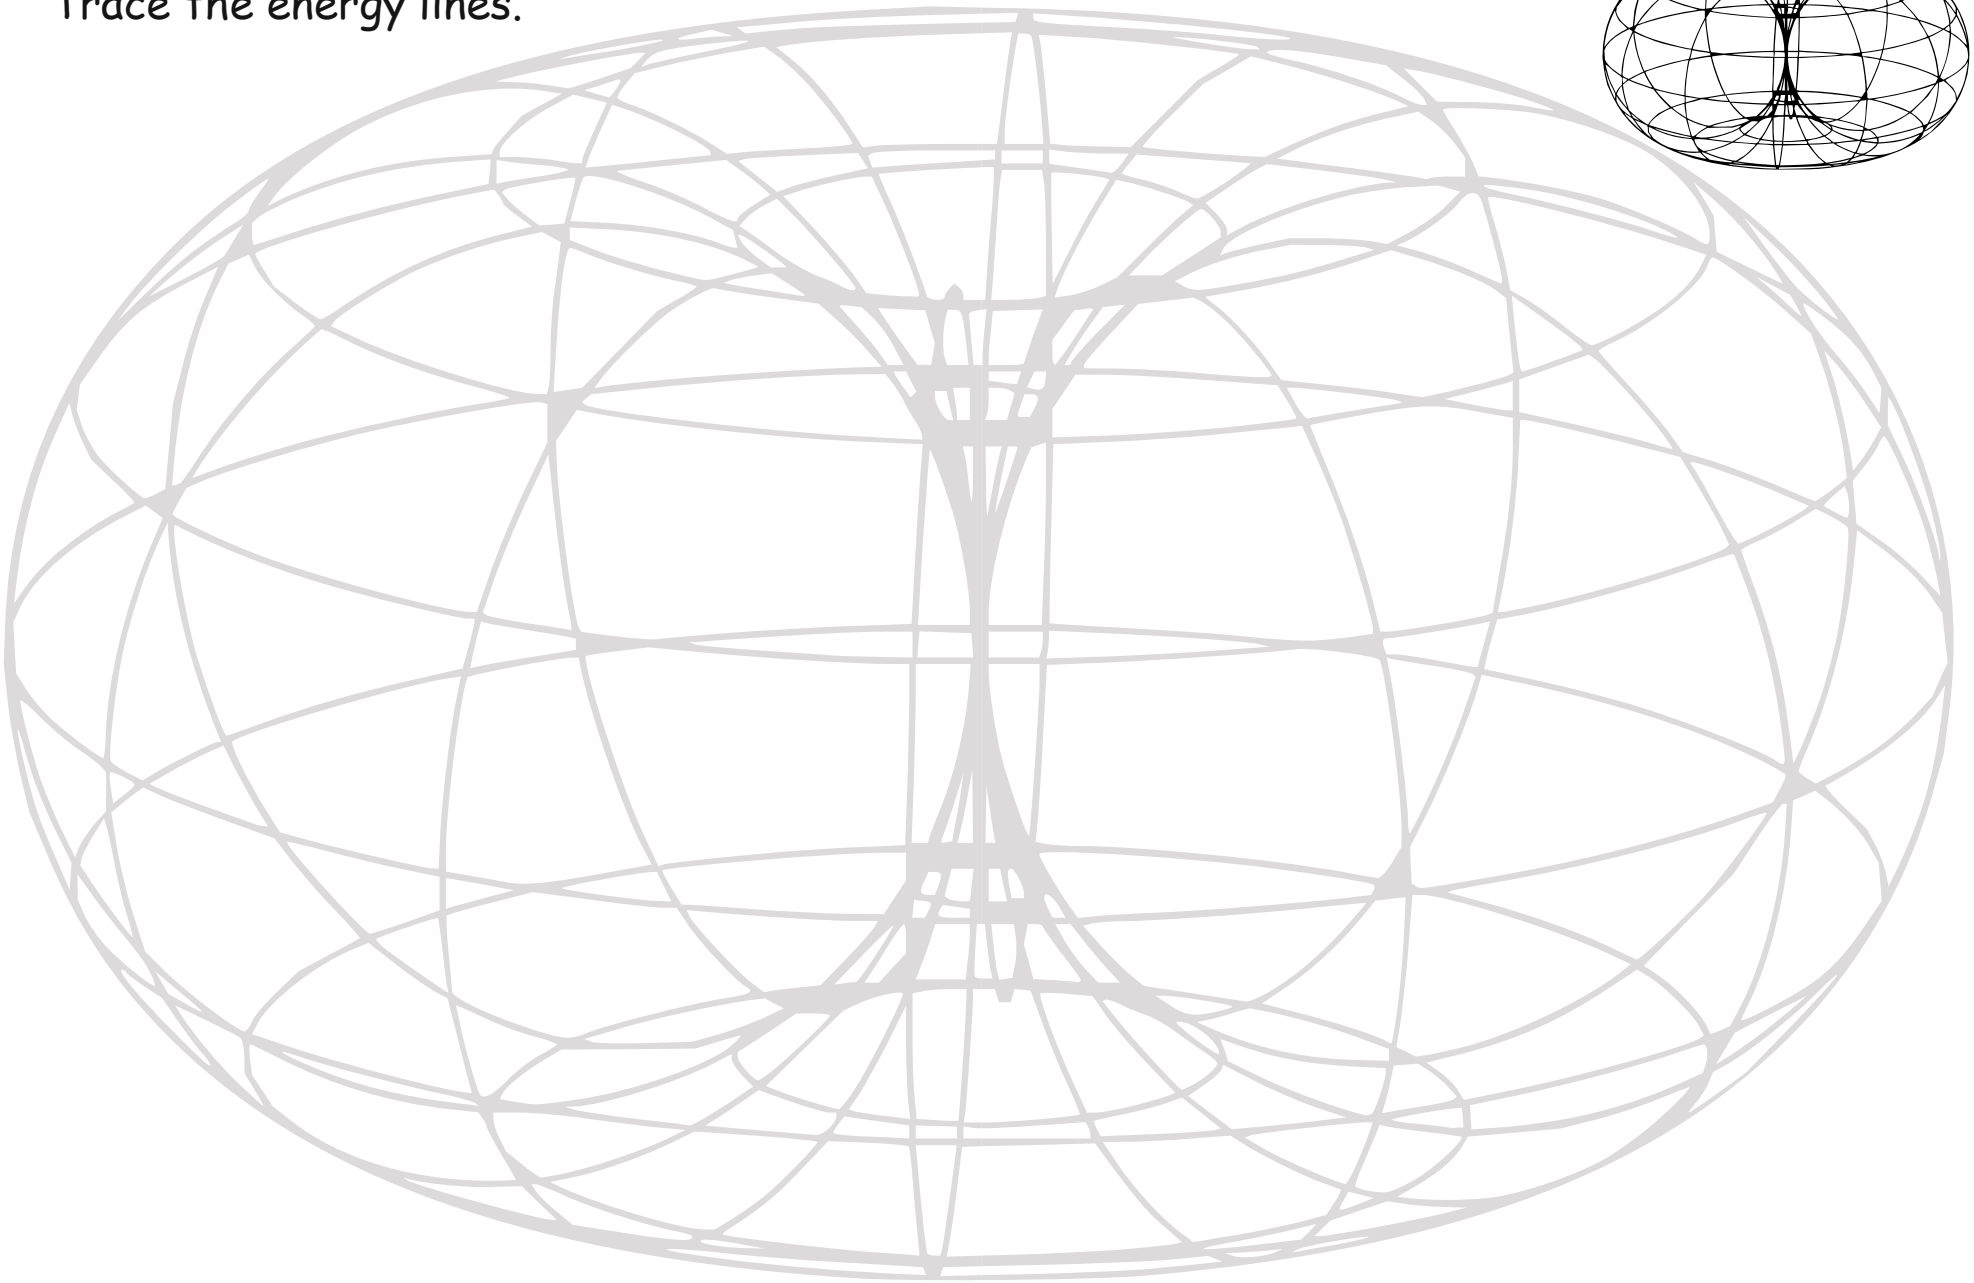
Try coloring the patterns and imagine what sound it makes!

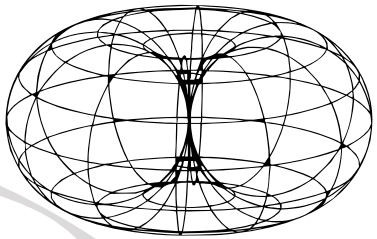
A **toroid** is a shape where energy moves in a loop.



It shows energy moving in a loop.

Trace the energy lines.





When energy loops, it can stay balanced and steady.
